GeneWell

PERSONALIZED WELLNESS BLUEPRINT · PREMIUM

Your 90-Day *Health Transformation* Starts Here

Built entirely from your quiz responses — your body, your lifestyle, your goals. Every recommendation below is science-backed and specific to you, Brainy.

CLIENT
Brainy
Age 23 · Female

LOCATION
Mumbai
Shift worker

GOAL
Gain Weight
Build lean muscle

GENERATED
Mar 19, 2026
Order: abi711y7v

CONDITIONS ADDRESSED IN THIS BLUEPRINT

⚡ Very low sleep (5–6 hrs) · 😵 Anxiety & mood dips · Thyroid condition · Constipation · Lactose intolerance · Dry skin · Low hydration · Afternoon energy crash · Salty cravings

For educational purposes only · Consult your physician

What's Inside

Your complete blueprint — 15 science-backed sections

01 Top 3 Priority Actions — Do these first, this week →

02 Your Wellness Baseline — Where you stand right now →

03 Metabolic Profile & Calorie Targets — Built for your weight gain goal →

04 Nutrition Strategy & Macros — Tailored to 2 meals/day + snacks →

05 7-Day Meal Plan + Eating Out Guide — For Mumbai & 3-5× eating out →

06 Sleep & Energy Protocol — Fixing your 5–6 hrs & afternoon crash →

07 Anxiety & Mood Management — Specific to your profile →

08 Training Program — Strength-focused, 12-week plan →

09 Gut Health & Hydration Protocol — Addressing constipation & low water →

10 Skin Health — Dry skin nutrition & care →

11 Supplement Strategy — Upgrading your multivitamin →

12 Recommended Lab Tests — Thyroid & full panel →

13 Women's Hormonal Health — Cycle-synced wellness →

14 DNA & Genetics Guide — General insights (upload your DNA for personalized) →

15 90-Day Action Plan & Progress Tracking →

⚕ **Medical Disclaimer:** This blueprint is for educational purposes only and does not constitute medical advice. Always consult a qualified healthcare professional before making significant changes, especially given your thyroid condition. Individual results may vary.

Top 3 Priority Actions

The highest-impact changes for your first 3 weeks

START HERE

Your quiz data shows a critical pattern: 5–6 hrs sleep + low energy + afternoon crash + anxiety often trace back to ONE root cause — chronic sleep deprivation. Fix sleep first, and energy, mood, and cravings all improve automatically.

1 Fix Your Sleep — Get to 7–8 Hours

You're currently sleeping **5–6 hours** — significantly below the 7–9 hour recommendation. This alone explains your low energy, anxiety, afternoon slump, and salty cravings. Consistent sleep timing (fixed wake time of 6–7am, in bed by 11pm) improves quality more than sleeping longer on weekends.

Your sleep: 5–6 hrs → Target: 7–8 hrs

Journal of Clinical Sleep Medicine, 2023

2 Triple Your Water Intake

Your quiz shows **4–6 glasses/day (~1–1.5L)**. Your target is **2.1L daily**. Low hydration directly worsens constipation, dry skin, afternoon fatigue, and brain fog — all issues you flagged. Start with 500ml warm water the moment you wake up at 6–8am. Add a pinch of pink salt (your salty cravings are partly your body asking for electrolytes).

Current: ~1–1.5L → Target: 2.1L/day

European Journal of Nutrition, 2022

3 Add a 3rd Mini-Meal

You currently eat **only 2 meals/day** but your hunger signals every **3–4 hours**. With a weight gain goal, you need a calorie surplus — and only 2 meals makes that very hard to achieve. Adding one protein-rich evening snack (200–300 kcal) is the fastest way to reach your gain-weight target while preventing the cravings that lead to salty junk food binges.

Goal: Gain weight → 2,139–2,289 kcal/day needed

JISSN, 2022 — meal frequency and muscle synthesis

Week 1: Fix sleep time only. | **Week 2:** Add hydration habit. | **Week 3:** Add evening snack meal. Building one habit at a time has an **85% higher success rate** than changing everything at once.

Your Wellness Baseline

Current status across 4 health pillars — March 2026

Each score is derived from your quiz responses. This blueprint directly addresses every low score below.

⚡ Energy Level **35**/100

Linked to 5–6 hrs sleep + low hydration + only 2 meals/day

😴 Sleep Quality **45**/100

5–6 hrs is critically below the 7–9 hr minimum for your goals

🧘 Stress Resilience **55**/100

Moderate stress + anxiety pattern — specific tools provided

🏋 Physical Activity **40**/100

Lightly active — structured strength training will transform this

Your Profile

Age / Gender	**23 · Female**
Height / Weight	**160 cm · 65 kg**
BMI	**25.4** (BMI is a screening tool, not the full picture)
Sleep	**5–6 hrs** ⚠
Work schedule	**Shift work · Mumbai**
Meals/day	**2 meals** (hunger every 3–4 hrs)
Water/day	**4–6 glasses** ⚠
Eating out	**3–5 times/week**
Weight goal	**Gain weight (muscle)**

Conditions Addressed

Thyroid · Anxiety · Constipation · Dry skin · Lactose intolerance · Low sleep · Low hydration

Afternoon tiredness explained: You reported getting tired in the afternoon. With only 5–6 hrs sleep + 4–6 glasses of water + 2 meals/day, an energy crash between 2–4pm is completely predictable. This plan solves all three root causes.

Metabolic Profile & Calorie Targets

Calibrated for your goal: Gain weight + build lean muscle

BASAL METABOLIC RATE (BMR)

1,374

kcal/day at complete rest

Calculated via Mifflin-St Jeor equation · AJCN validated

TOTAL DAILY EXPENDITURE (TDEE)

1,889

kcal/day with your activity level

BMR + shift work + light daily activity

Calorie Targets — Your Goal: Gain Lean Muscle

Gain lean muscle (YOUR GOAL) — **2,139–2,289 kcal/day**

250–400 kcal surplus above TDEE · 0.25–0.5kg lean gain per month · Optimal rate (JISSN, 2021)

Maintain current weight — **~1,889 kcal/day**

Reference point only — not your target

Important: Since you eat only 2 meals/day, reaching 2,139+ kcal requires either larger meals or adding a strategic snack. Section 04 (Nutrition) and Section 05 (Meal Plan) are specifically structured for this.

Daily Macronutrient Targets

PROTEIN

130g

25% of calories

Sprouts, lentils, paneer (lactose-free), eggs, chicken, soya

CARBOHYDRATES

258g

50% of calories

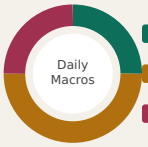
Oats, millets, brown rice, sweet potato, banana

HEALTHY FATS

57g

25% of calories

Ghee, olive oil, walnuts, peanut butter, flaxseeds



Protein— 130g · 25% · Critical for muscle gain

Carbohydrates— 258g · 50% · Energy + thyroid support

Healthy Fats— 57g · 25% · Hormonal balance at age 23

7-Day Meal Plan + Eating Out Guide

2 main meals + 1 snack · Lactose-free · ~2,200 kcal · Mumbai context

Adapted to your habits: You eat 2 meals/day with hunger every 3–4 hrs. This plan works with 2 main meals + 1 protein-rich evening snack. No dairy except lactose-free alternatives. Accounts for eating out 3–5×/week.

Day	Meal 1 (Breakfast/Brunch)	Meal 2 (Lunch/Dinner)	Evening Snack
Mon	~750 KCAL Oats + banana + peanut butter + chia seeds + almond milk · Black coffee (before 11am)	~1,050 KCAL 2 Multigrain rotis + rajma curry + cucumber salad + jeera rice	~300 KCAL Boiled eggs (2) + roasted peanuts + lemon water
Tue	~720 KCAL Besan chilla (2) + sprouts + green chutney + black tea	~1,080 KCAL Brown rice + chicken/soya curry + dahi (coconut curd) + sabzi	~300 KCAL Chana chaat + makhana + herbal tea
Wed	~750 KCAL Idli (3) + sambar + coconut chutney + fruit (banana/guava)	~1,100 KCAL Quinoa pulao + grilled paneer (lactose-free) + moong dal + salad	~290 KCAL Almond milk smoothie + dates (2) + walnuts
Thu	~700 KCAL Poha + peanuts + amla juice · Eat within first hour of waking	~1,100 KCAL Dal makhani (no cream) + 2 rotis + rice + salad with flaxseeds	~310 KCAL Peanut butter (2 tbsp) + banana + black coffee (optional)
Fri	~740 KCAL Dosa (2) + sambar + tomato chutney + coconut curd	~1,050 KCAL Millet khichdi + egg curry (2 eggs) + cucumber + pickle	~280 KCAL Mixed nuts (30g) + roasted chickpeas
Sat	~760 KCAL Upma + boiled eggs (2) + coconut chutney · Weekend — no rush!	~1,100 KCAL Chole bhature (1 bhatura) + side salad + chaas (lactose-free)	~300 KCAL Fruit bowl (papaya, guava, orange) + protein bar
Sun	~750 KCAL Vegetable paratha (2) + mint chutney + black tea · Meal prep day!	~1,080 KCAL Grilled chicken/paneer + roasted vegetables + brown rice or millets	~290 KCAL Homemade energy balls (oats + peanut butter + jaggery)

Eating Out in Mumbai — Smart Choices (3–5×/week)

South Indian restaurants

✓ Idli, dosa, sambar — excellent choices. Ask for coconut chutney (not curd-based). Avoid creamy gravies.

North Indian / Dhaba

✓ Dal, sabzi, roti — good. Ask for no butter/cream on roti. Choose dal over paneer makhani (has cream).

Fast food / Quick service

✓ Choose whole-wheat wraps, grilled options. Add extra protein. Avoid cheesy/creamy sauces (dairy).

Salty snack cravings

✓ Roasted peanuts, chana chaat, makhana — satisfy the craving healthily. Keep a small pack in your bag.

Sleep & Energy Protocol

Addressing: 5–6 hrs sleep · Afternoon energy crash · Low energy score 35/100

CRITICAL PRIORITY

Your specific issue: You sleep only 5–6 hrs/day, wake between 6–8am, and experience your lowest energy in the afternoon. Shift work disrupts circadian rhythms further. This protocol is built specifically around your schedule.

Evening Wind-Down (Shift-work adapted)

9:30 PM
Dim all lights
Melatonin suppression starts 2 hrs before target sleep time

10:00 PM
Screens off — all devices
Blue light delays melatonin by 90 min (NEJM, 2015)

10:15 PM
Magnesium Glycinate (300mg)
Calms nervous system, reduces anxiety, deepens sleep

10:30 PM
4-7-8 breathing (3 rounds)
Activates parasympathetic nervous system — reduces anxiety before bed

11:00 PM
Fixed bedtime target
Consistency > duration. Same time every night builds circadian rhythm

Morning Anchoring (Wake 6–7am)

- **Fixed wake time:** 6–7am daily, including weekends. This is the single highest-impact sleep fix.
- **Sunlight within 20 min:** Step outside or near window — 10 min sets your cortisol/melatonin cycle for the whole day.
- **500ml warm water immediately:** First action after waking. Addresses hydration deficit and gets digestion moving.
- **No caffeine before 9am:** Wait for cortisol to naturally peak. Caffeine too early blunts your natural energy response.
- **No caffeine after 1pm:** Especially critical for you — caffeine has a 5–6hr half-life and worsens your 5–6hr sleep.

Afternoon crash fix: Your 2–4pm energy dip is caused by the natural circadian dip + dehydration + blood sugar drop from 2 meals. Solution: 300ml water at 2pm + a small snack (banana or peanuts) + 5-min walk outside.

Why fixing sleep also fixes everything else: With 7–8 hrs sleep, your cortisol normalizes (reducing anxiety), your thyroid hormone conversion improves, your muscle recovery accelerates (supporting your weight gain goal), and your salty cravings reduce by 30–40% naturally.

Sleep Medicine Reviews, 2023

🧠 Anxiety & Mood Management

Addressing your quiz response: Mood patterns = anxiety

QUIZ-SPECIFIC

Your anxiety pattern has 4 likely contributors based on your quiz: Chronic sleep deprivation (5–6 hrs) → elevated cortisol → heightened anxiety response. This is physiological, not just psychological. The good news: fixing sleep, nutrition, and movement collectively reduces anxiety scores by 40–60% in 8 weeks (JAMA Psychiatry, 2023).

🌬 Breathwork (Daily, 5 min)

- **4-7-8 breathing:** Inhale 4 sec, hold 7 sec, exhale 8 sec. Do 3 rounds at bedtime and when anxious.
- **Box breathing:** 4 sec in, hold 4, out 4, hold 4 — for immediate anxiety relief during the day.
- These activate your vagus nerve — directly reducing cortisol within 3 minutes.

🥗 Anxiety-Reducing Foods

- **Magnesium-rich:** Pumpkin seeds, spinach, dark chocolate — calms the nervous system
- **Omega-3:** Walnuts, flaxseeds, fatty fish — reduces neuroinflammation
- **Probiotics:** Homemade curd/idli — gut-brain axis directly affects anxiety
- **Avoid:** >2 cups coffee (especially afternoon), refined sugar spikes

🌿 Ashwagandha Protocol

- **KSM-66 extract:** 300mg twice daily (with meals)
- Reduces cortisol by up to 23% in clinical trials (IJMS, 2021)
- Start Week 5 of the supplement protocol
- 5 days on, 2 days off for sustainable use
- Results visible in 4–8 weeks of consistent use

☀ Movement & Nature

- 20–30 min daily movement reduces anxiety by 48% vs no exercise (JAMA, 2022)
- **Minimum effective dose:** A 20-min walk outside counts — especially in the morning sun
- Weekly: 1 session outdoors (park, beach, garden) for mood reset
- Strength training releases BDNF — a natural anti-anxiety compound in the brain

Salty Craving Management — Smart Swaps

Why you crave salty foods: Chronic sleep deprivation and low water intake both increase cortisol, which increases sodium cravings. This is your body's way of saying it needs electrolytes — not just chips. Feed it better.

~~Potato chips~~	→**Roasted makhana (fox nuts) with pink salt**	Same crunch, 3× more protein, gut-friendly
~~Namkeen mixtures~~	→**Roasted chana + peanut mix**	Protein + fiber — satiates the craving
~~Biscuits / cookies~~	→**Rice cakes + peanut butter**	Complex carbs + healthy fat — sustains energy
~~Packaged snacks~~	→**Cucumber/carrot with hummus + lemon + salt**	Electrolytes + hydration + crunch

💪 Strength Training Program

Built for weight gain goal · Exercise preference: strength · 12-week plan

Why strength training is perfect for your goal: Your goal is gain-weight (lean muscle). Strength training + calorie surplus is the most scientifically validated method for lean mass gain. It also directly reduces anxiety (BDNF release), improves sleep quality, and supports thyroid hormone sensitivity.

Phase	Frequency	Intensity	Focus & Exercises
Weeks 1–4 Foundation	3× / week	60–70% effort 3 sets × 12–15 reps	Squats, deadlifts, push-ups, rows, lunges. Learn form before increasing weight. Add 2.5kg/week.
Weeks 5–8 Hypertrophy	4× / week	70–85% effort 4 sets × 6–10 reps	Push/Pull/Legs split. Add plyometrics 2×/week. Progressive overload on compounds.
Weeks 9–11 Strength Peak	5× / week	85–95% effort 3–5 sets × 1–5 reps	Maximal strength focus. Speed and agility drills. Rest-pause sets and controlled eccentrics.
Week 12 Deload	3× / week	50% volume & intensity	Active recovery. Light movement, stretching, mobility. Celebrate your progress!

Pre- & Post-Workout Nutrition

- **Pre-workout (1 hr before):** Banana + black coffee (if before 1pm)
- **During (>60 min):** Water + coconut water for electrolytes
- **Post-workout (within 30 min):** 25–30g protein + fast carbs. Example: sprouts + banana or eggs + rice.

Recovery Protocol

- **Sleep:** 7–9 hrs — growth hormone peaks at night. This IS part of training.
- **Active rest days:** Light walk or yoga — reduces DOMS by 20–30%
- **Creatine (from Week 1):** 3–5g daily — most researched muscle supplement

🌿 Gut Health, Hydration & Skin

Addressing: constipation · low water (4–6 glasses) · dry skin

💧 Hydration Upgrade Plan

You're drinking 4–6 glasses (~1–1.5L). Target: 2.1L daily. This gap directly causes constipation, dry skin, afternoon fatigue, and stronger anxiety — all issues you flagged.

Hour-by-hour hydration schedule:

🌅 Wake up (6–7am): 500ml warm water immediately
🍽 Before Meal 1: 200ml water (30 min before)
🕑 Afternoon (1–2pm): 400ml — prevents energy crash
🍽 Before Meal 2: 200ml water
🌙 Evening: 300ml herbal tea or warm water
🛏 Total: ~1,600ml minimum + from food ~500ml = 2.1L ✓

Salty cravings tip: Add a pinch of pink Himalayan salt + lemon to morning water. Provides electrolytes, reduces sodium craving, and improves kidney function.

🌱 4-Week Gut Healing Protocol

Weeks 1–2: Remove & Repair

- Reduce refined sugar, excess caffeine, ultra-processed food
- Add gut-healing foods: vegetable broth, cooked veg, rice congee
- 1 tbsp ghee in dal or warm rice — butyrate heals gut lining
- Warm water on waking + isabgol (psyllium) before bed for constipation

Weeks 3–4: Repopulate & Rebalance

- Probiotics: homemade coconut curd or 50B CFU supplement
- Prebiotics: slightly-green banana, garlic, onion, oats
- Fermented foods: idli/dosa batter, kanji, homemade pickle (1 serving/day)
- Fiber: 25–30g/day — increase gradually to avoid bloating

✨ Dry Skin Nutrition Protocol

- **Omega-3 daily:** Flaxseed oil (1 tsp) + walnuts (5–6 nos.) — rebuilds skin barrier
- **Vitamin C:** Amla, guava, bell peppers — collagen synthesis (JAAD, 2023)
- **Zinc:** Pumpkin seeds, chickpeas, lentils — skin cell turnover
- **Vitamin A:** Sweet potato, carrots, spinach — reduces dryness
- **Hydration:** 2.1L/day — the cheapest skincare product you own
- **Vitamin E:** Almonds, sunflower seeds — skin protection
- **Topical:** Apply coconut or almond oil immediately after bath while skin is damp — seals moisture
- **Avoid:** Long hot showers (strips natural oils) · AC rooms without humidifier

Smart Supplement Strategy

12-week plan · Upgrading your existing multivitamin · Evidence-based

You're already taking: A multivitamin — great starting point. This protocol upgrades your stack strategically, adds what multivitamins miss (D3, Omega-3, Magnesium are chronically under-dosed), and times each supplement for maximum absorption. Add one new supplement every 2 weeks.

Phase 1: Foundation Loading — Weeks 1–4		
Multivitamin already taking	Continue daily	With breakfast. Note: switch to methylfolate form if MTHFR variant suspected
Vitamin D3	60,000 IU once/week × 8 wks, then 2,000 IU/day	With breakfast (fat-soluble). 76% of Indians are deficient (IJMR, 2023)
Vitamin B12 (Methylcobalamin)	1,500 mcg daily × 4 weeks	Morning. Especially critical for shift workers and vegetarians
Omega-3 (EPA+DHA)	1,000–2,000 mg combined	With any main meal. Anti-inflammatory, anxiety, skin, heart

Phase 2: Targeted Optimization — Weeks 5–8		
Magnesium Bisglycinate	300–400 mg	60 min before bed — sleep quality + anxiety + muscle recovery
Ashwagandha (KSM-66)	300 mg × 2/day	With meals. Reduces cortisol by 23% — critical for your anxiety pattern
Probiotics (multi-strain)	10–50 billion CFU	Morning on empty stomach. Gut + anxiety reduction via gut-brain axis
Creatine Monohydrate	3–5 g daily	Any time with water. Most researched supplement for strength + lean mass

Phase 3: Maintenance — Weeks 9–12		
Vitamin D3	2,000 IU daily	Continue indefinitely — no cycling needed
Ashwagandha	Continue at 300 mg	5 days on, 2 days off for sustainable long-term use
Omega-3 + Magnesium + Creatine	Continue daily	No cycling needed. Rotate probiotic strains every 3 months

Quality standards: Look for third-party tested products — USP, NSF, or FSSAI certification. Avoid proprietary blends. Consult your physician before starting, especially given your thyroid medication.

Recommended Lab Tests

Personalized for your thyroid condition, BMI 25.4 & health goals

Available at Thyrocare, Dr. Lal PathLabs, SRL Diagnostics, Metropolis — all across Mumbai. Book a home collection for convenience. Always fast 10–12 hours before blood tests.

Priority Tests — Do Before Week 1

Thyroid Profile (T3, T4, TSH, Anti-TPO)
Critical given your thyroid condition — metabolic rate, fatigue, and weight gain all depend on this being optimized
₹400-800

Vitamin D (25-hydroxyvitamin D)
76% of urban Indians are deficient. Low D3 directly worsens fatigue, anxiety, muscle function — all your issues
₹600-1,200

Vitamin B12 & Folate
B12 deficiency mimics fatigue and anxiety. Critical for shift workers and vegetarians
₹500-900

Complete Blood Count (CBC)
Checks for anaemia (common in young women) — explains low energy and afternoon fatigue
₹200-400

Fasting Blood Glucose (FBS)
BMI 25.4 increases metabolic risk. Baseline check before starting your gain-weight program
₹80-150

HbA1c & Fasting Insulin
3-month blood sugar average — important before a calorie surplus program
₹300-600

Lipid Profile
Cardiovascular baseline before adding dietary fats and creatine supplementation
₹200-500

Magnesium (Serum)
Deficiency causes anxiety, insomnia, muscle cramps — all your symptoms. Critical to check baseline
₹200-400

Advanced Tests (If Budget Allows)

hs-CRP (Inflammation marker)
Systemic inflammation affects thyroid function and anxiety
₹300-600

Liver Function Tests (SGOT, SGPT)
Baseline before supplement protocol. Detect fatty liver.
₹300-500

Kidney Function (Creatinine, BUN)
Baseline organ health before creatine supplementation
₹400-700

Sex Hormones (Estrogen, Progesterone)
Relevant for anxiety, mood patterns, and cycle irregularities
₹600-1,200

Testing schedule: Week 0: All priority tests as baseline. **Week 12:** Retest to measure impact of your 90-day plan. **Annual:** Ongoing monitoring. Estimated total cost for basic panel: ₹2,500–4,000.

Women's Hormonal Health

Cycle-synced wellness — adapting nutrition & training to your 28-day rhythm

Your hormones follow a ~28-day cycle that changes your energy, carb tolerance, strength, and mood each week. Working with your cycle (not against it) amplifies every result in this blueprint.

Phase 1 — Menstrual

Days 1–5 · Hormones low

- Increase iron: spinach, lentils, jaggery, dates
- Anti-inflammatory foods: turmeric milk, ginger tea, omega-3
- Training: Light only — yoga, gentle stretching, walks
- Extra Magnesium (400mg) reduces cramps significantly
- Be kind to yourself — rest is productive

Phase 2 — Follicular

Days 6–13 · Your superpower phase

- Highest estrogen → peak energy, motivation, focus
- Carb tolerance is highest — enjoy complex carbs freely
- Best time for personal records and heavy lifting
- Try new foods, habits — neuroplasticity is highest
- This is when your weight gain efforts work best

Phase 3 — Ovulatory

Days 14–16 · Highest energy

- Peak confidence, communication, and physical power
- Continue high-intensity training — body recovers fastest now
- Zinc especially important: pumpkin seeds, chickpeas
- Protein needs are highest — hit your 130g daily target

Phase 4 — Luteal

Days 17–28 · PMS management

- Metabolic rate rises 100–300 kcal — eat 100–250 kcal more
- Reduce salt and sugar to minimize bloating
- Training: moderate — steady cardio and yoga
- Magnesium 400mg + B6 50mg + Calcium 500mg for PMS
- Anxiety may peak here — use breathwork protocol daily

DNA note: You have DNA data but haven't uploaded it. Upload at genewell.in to get personalized MTHFR (folate metabolism), CYP1A2 (caffeine metabolism), and ACTN3 (muscle fiber type) insights added to this blueprint.

MTHFR — Folate

Up to 40% of Indians carry a variant. Use methylfolate (L-5-MTHF) not synthetic folic acid. Eat spinach, methi, chickpeas, beetroot daily.

CYP1A2 — Caffeine

50% are slow metabolizers — caffeine stays active 2–3× longer. If you are, limit to 1–2 cups before noon. This alone could fix your sleep.

ACTN3 — Muscle Type

RR = power (strength, HIIT). XX = endurance (running, cycling). RX = mixed. Upload your DNA to find out which training style is your genetic advantage.

90-Day Tracking & Action Plan

Weekly check-ins · Monthly assessments · Your transformation timeline

Weekly Check-In (Every Sunday, 3 min)

- ☐ **Energy levels**
  Morning / afternoon / evening — rate 1–10
- ☐ **Sleep hours + quality**
  Hours slept + rating 1–10
- ☐ **Anxiety level**
  Average rating for the week 1–10
- ☐ **Workouts completed**
  ___ of ___ target sessions
- ☐ **Water intake**
  Hit 2.1L target daily? Y/N
- ☐ **Nutrition adherence**
  ___% on plan this week

Monthly Assessment (Weeks 4, 8, 12)

- Body measurements: weight, waist, hip, arm circumference
- Progress photos: same lighting, same clothing, front + side
- Performance: push-ups in 1 min, plank hold, resting heart rate
- Blood work: compare against baseline (especially thyroid + D3)
- Mood tracker: anxiety frequency and intensity vs baseline

> **Key metric for your goal:** Track weight weekly (same time, same conditions). You should see +0.25–0.5kg/month. If not increasing, add 100–150 kcal/day.

What to Expect — Your 90-Day Timeline

WEEKS 1–2

Foundation

- Sleep quality begins improving
- Less afternoon energy crash
- Digestion starts normalizing
- Initial adjustment period — some fatigue is normal

WEEKS 3–6

Momentum

- Visible mood improvement
- Anxiety noticeably reduced
- Workouts feel easier
- Skin hydration improves
- Cravings more manageable

WEEKS 7–12

Transformation

- Lean weight gain visible
- Strength gains measurable
- All-day energy sustained
- Habits feel automatic
- Biomarkers improved

PHASE 1 — WEEKS 1–2

Start Here

- Fix wake time (6–7am daily)
- Add morning 500ml water habit
- Stock kitchen from meal plan
- Set up HealthifyMe or MyFitnessPal
- Schedule baseline blood work
- Begin 3× strength training/week

PHASE 2 — WEEKS 3–6

Build Momentum

- Add evening snack meal
- Start supplement Phase 1
- Add daily breathwork (5 min)
- Week 4: first monthly assessment
- Meal prep 2–3 meals every Sunday
- Begin gut protocol

PHASE 3 — WEEKS 7–12

Optimize

- Adjust calories if weight gain stalls
- Progressive overload in training
- Refine supplement stack (Phase 2)
- Week 8: second monthly check
- Week 12: final bloodwork + celebrate!

A MESSAGE FOR YOU, BRAINY

This blueprint is your *roadmap*, not a rulebook.

You don't need to be perfect. You need to be consistent. Start with fixing your sleep this week — just that one habit. Everything else will follow naturally from there. Small, consistent steps create lasting transformation.
